

**PRELIMINARY**

Some of contents are subject to change without notice.

**DESCRIPTION**

P2S28D30CTP is a 4-bank x 4,194,304-word x 8bit, P2S28D40CTP is a 4-bank x 2,097,152-word x 16bit double data rate synchronous DRAM , with SSTL\_2 interface. All control and address signals are referenced to the rising edge of CLK. Input data is registered on both edges of data strobe ,and output data and data strobe are referenced on both edges of CLK. The P2S28D30/40CTP achieves very high speed clock rate up to 200 MHz .

**FEATURES**

- Vdd=Vddq=2.5V±0.2V
- Double data rate architecture ; two data transfers per clock cycle.
- Bidirectional , data strobe (DQS) is transmitted/received with data
- Differential clock input (CLK and /CLK)
- DLL aligns DQ and DQS transitions with CLK transitions edges of DQS
- Commands entered on each positive CLK edge ;
- Data and data mask referenced to both edges of DQS
- 4 bank operation controlled by BA0 , BA1 (Bank Address)
- /CAS latency -2.0 / 2.5/ 3 (programmable) ;  
Burst length - 2 / 4 / 8 (programmable)  
Burst type - Sequential / Interleave (programmable)
- Auto precharge / All bank precharge controlled by A10
- 8192 refresh cycles / 64ms (4 banks concurrent refresh)
- Auto refresh and Self refresh
- Row address A0-11 / Column address A0-9 , A0-9(x8) /A0-8(x16)
- SSTL\_2 Interface
- Package  
400-mil, 66-pin Thin Small Outline Package (TSOP II)  
with 0.65mm lead pitch
- JEDEC standard for -6 , -75
- Intel standard for -5

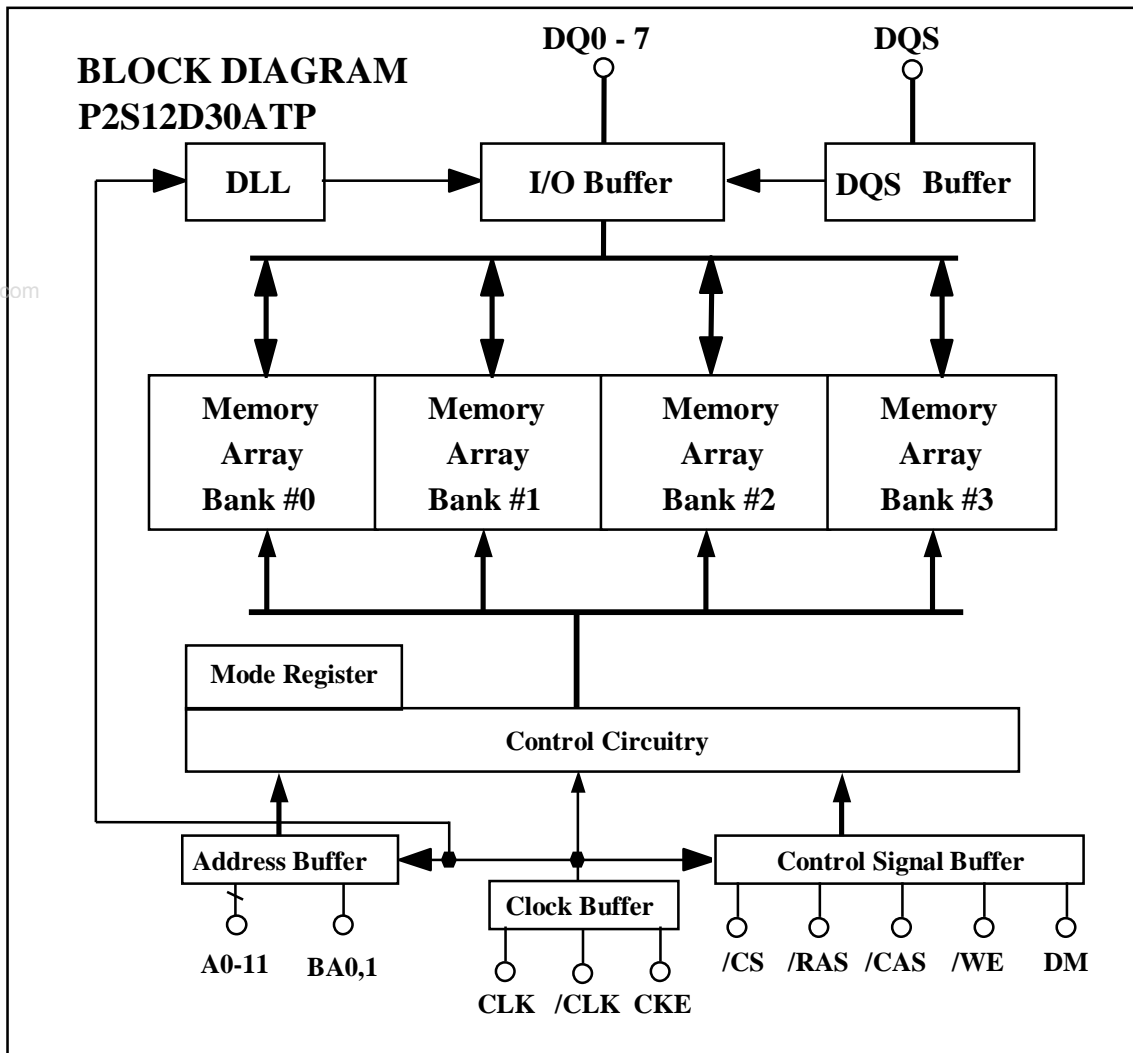

**Pin Assignment (Top View) 66-pin TSOP**

**PIN FUNCTION**

SYMBOL	TYPE	DESCRIPTION
CLK, /CLK	Input	Clock: CLK and /CLK are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CLK and negative edge of /CLK. Output (read) data is referenced to the crossings of CLK and /CLK (both directions of crossing).
CKE	Input	Clock Enable: CKE controls internal clock. When CKE is low, internal clock for the following cycle is ceased. CKE is also used to select auto / self refresh. After self refresh mode is started, CKE becomes asynchronous input. Self refresh is maintained as long as CKE is low.
/CS	Input	Chip Select: When /CS is high, any command means No Operation.
/RAS, /CAS, /WE	Input	Combination of /RAS, /CAS, /WE defines basic commands.
A0-11	Input	A0-11 specify the Row / Column Address in conjunction with BA0,1. The Row Address is specified by A0-11. The Column Address is specified by A0-9(x8) and A0-8(x16). A10 is also used to indicate precharge option. When A10 is high at a read / write command, an auto precharge is performed. When A10 is high at a precharge command, all banks are precharged.
BA0,1	Input	Bank Address: BA0,1 specifies one of four banks to which a command is applied. BA0,1 must be set with ACT, PRE, READ, WRITE commands.
DQ0-7 (x8), DQ0-15 (x16),	Input / Output	Data Input/Output: Data bus
DQS (x8) UDQS, LDQS (x16)	Input / Output	Data Strobe: Output with read data, input with write data. Edge-aligned with read data, centered in write data. Used to capture write data. For the x16, LDQS corresponds to the data on DQ0-DQ7; UDQS correspond to the data on DQ8-DQ15
DM (x8) UDM, LDM (x16)	Input	Input Data Mask: DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with that input data during a WRITE access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading. For the x16, LDM corresponds to the data on DQ0-DQ7; UDM corresponds to the data on DQ8-DQ15.
Vdd, Vss	Power Supply	Power Supply for the memory array and peripheral circuitry.
VddQ, VssQ	Power Supply	VddQ and VssQ are supplied to the Output Buffers only.
Vref	Input	SSTL_2 reference voltage.

**Type Designation Code**

This rule is applied to only Synchronous DRAM family.

P 2 S 28 D 4 0 C T P -G5

- G: Lead Free
- Speed Grade 75: 133MHz @CL=2.5, and 100MHz @CL=2.0
- 6: 167MHz @CL=2.5, and 133MHz @CL=2.0
- 5: 200MHz @CL=3.0, 167MHz @CL=2.5, and 133MHz @CL=2.0
- Package Type TP: TSOP(II)
- Process Generation
- Function Reserved for Future Use
- Organization 2<sup>n</sup> 2: x4, 3: x8, 4: x16
- DDR Synchronous DRAM
- Density 28: 128M bits
- Interface S:SSTL\_3, \_2
- Memory Style (DRAM)
- MIRA DRAM

**BASIC FUNCTIONS**

The P2S28D30/40CTP provides basic functions, bank (row) activate, burst read / write, bank (row) precharge, and auto / self refresh. Each command is defined by control signals of /RAS, /CAS and /WE at CLK rising edge. In addition to 3 signals, /CS ,CKE and A10 are used as chip select, refresh option, and precharge option, respectively. To know the detailed definition of commands, please see the command truth table.

www.DataSheet4U.com

**Activate (ACT) [/RAS =L, /CAS =/WE =H]**

ACT command activates a row in an idle bank indicated by BA.

**Read (READ) [/RAS =H, /CAS =L, /WE =H]**

READ command starts burst read from the active bank indicated by BA. First output data appears after /CAS latency. When A10 =H at this command, the bank is deactivated after the burst read (auto-precharge, **READA**)

**Write (WRITE) [/RAS =H, /CAS =/WE =L]**

WRITE command starts burst write to the active bank indicated by BA. Total data length to be written is set by burst length. When A10 =H at this command, the bank is deactivated after the burst write (auto-precharge, **WRITEA**)

**Precharge (PRE) [/RAS =L, /CAS =H, /WE =L]**

PRE command deactivates the active bank indicated by BA. This command also terminates burst read /write operation. When A10 =H at this command, all banks are deactivated (precharge all, **PREA** ).

**Auto-Refresh (REFA) [/RAS =/CAS =L, /WE =CKE =H]**

REFA command starts auto-refresh cycle. Refresh address including bank address are generated internally. After this command, the banks are precharged automatically.

**COMMAND TRUTH TABLE**

COMMAND	MNEMONIC	CKE <sub>n-1</sub>	CKE <sub>n</sub>	/CS	/RAS	/CAS	/WE	BA0,1	A10/AP	A0-9,11	note

**ABBREVIATIONS:**

H=High Level, L=Low Level, X=Don't Care

BA=Bank Address, RA=Row Address, CA=Column Address, NOP=No Operation

**NOTES:**

1. All entries assume that CKE was High during the preceding clock cycle and the current clock cycle.
2. ILLEGAL to bank in specified state; function may be legal in the bank indicated by BA, depending on the state of that bank.
3. Must satisfy bus contention, bus turn around, write recovery requirements.
4. NOP to bank precharging or in idle state. May precharge bank indicated by BA.
5. ILLEGAL if any bank is not idle.

ILLEGAL = Device operation and/or data-integrity are not guaranteed.

	L	L	X	X	X	X	X	Maintain CLK Suspend	

ABBREVIATIONS:

H=High Level, L=Low Level, X=Don't Care

NOTES:

1. CKE Low to High transition will re-enable CLK and other inputs asynchronously.  
A minimum setup time must be satisfied before any command other than EXIT.
2. Power-Down and Self-Refresh can be entered only from the All Banks Idle State.
3. Must be legal command.

**SIMPLIFIED STATE DIAGRAM**

### POWER ON SEQUENCE

Before starting normal operation, the following power on sequence is necessary to prevent a SDRAM from damaged or multifunctioning.

1. Apply VDD before or the same time as VDDQ
2. Apply VDDQ before or at the same time as VTT & Vref
3. Maintain stable condition for 200us after stable power and CLK, apply NOP or DSEL
4. Issue precharge command for all banks of the device
5. Issue EMRS
6. Issue MRS for the Mode Register and to reset the DLL
7. Issue 2 or more Auto Refresh commands
8. Maintain stable condition for 200 cycle

After these sequence, the DDR SDRAM is idle state and ready for normal operation.

### MODE REGISTER

Burst Length, Burst Type and /CAS Latency can be programmed by setting the mode register (MRS). The mode register stores these data until the next MRS command, which may be issued when all banks are in idle state. After tMRD from a MRS command, the DDR SDRAM is ready for new command.

BA1	BA0	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1	A0

	Sequential	Interleaved

DLL Reset	0	1
	NO	YES

R: Reserved for Future Use

### EXTENDED MODE REGISTER

DLL disable / enable mode can be programmed by setting the extended mode register (EMRS). The extended mode register stores these data until the next EMRS command, which may be issued when all banks are in idle state. After tMRD from a EMRS command, the DDR SDRAM is ready for new command.

**Output Load Condition**

## Notes

1. All voltages referenced to  $V_{SS}$ .
2. Tests for AC timing, IDD, and electrical, AC and DC characteristics, may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.
3. AC timing and IDD tests may use a  $V_{IL}$  to  $V_{IH}$  swing of up to 1.5V in the test environment, but input timing is still referenced to  $V_{REF}$  (or to the crossing point for  $CK//\overline{CK}$ ), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals is 1V/ns in the range between  $V_{IL}(AC)$  and  $V_{IH}(AC)$ .
4. The AC and DC input level specifications are as defined in the SSTL\_2 Standard (i.e. the receiver will effectively switch as a result of the signal crossing the AC input level, and will remain in that state as long as the signal does not ring back above (below) the DC input LOW (HIGH) level.
5.  $V_{REF}$  is expected to be equal to  $0.5 \cdot V_{DDQ}$  of the transmitting device, and to track variations in the DC level of the same. Peak-to-peak noise on  $V_{REF}$  may not exceed  $\pm 2\%$  of the DC value.
6.  $V_{TT}$  is not applied directly to the device.  $V_{TT}$  is a system supply for signal termination resistors, is expected to be set equal to  $V_{REF}$ , and must track variations in the DC level of  $V_{REF}$ .
7.  $V_{ID}$  is the magnitude of the difference between the input level on  $CLK$  and the input level on  $\overline{CLK}$ .
8. The value of  $V_{IX}$  is expected to equal  $0.5 \cdot V_{DDQ}$  of the transmitting device and must track variations in the DC level of the same.
9. Enables on-chip refresh and address counters.
10. IDD specifications are tested after the device is properly initialized.
11. This parameter is sampled.  $V_{DDQ} = 2.5V \pm 0.2V$ ,  $V_{DD} = 2.5V \pm 0.2V$ ,  $f = 100$  MHz,  $T_a = 25^\circ C$ ,  $V_{OUT}(DC) = V_{DDQ}/2$ ,  $V_{OUT}(PEAK\ TO\ PEAK) = 25mV$ . DM inputs are grouped with I/O pins - reflecting the fact that they are matched in loading (to facilitate trace matching at the board level).
12. The  $CLK//\overline{CLK}$  input reference level (for timing referenced to  $CLK//\overline{CLK}$ ) is the point at which  $CLK$  and  $\overline{CLK}$  cross; the input reference level for signals other than  $CLK//\overline{CLK}$ , is  $V_{REF}$ .
13. Inputs are not recognized as valid until  $V_{REF}$  stabilizes. Exception: during the period before  $V_{REF}$  stabilizes,  $CKE \leq 0.3V_{DDQ}$  is recognized as LOW.
14.  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (HZ), or begins driving (LZ).
15. The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.
16. The specific requirement is that DQS be valid (HIGH, LOW, or at some point on a valid transition) on or before this  $CLK$  edge. A valid transition is defined as monotonic, and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from High-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on  $t_{DQSS}$ .
17. A maximum of eight AUTO REFRESH commands can be posted to any given DDR SDRAM device.
18.  $t_{XPRD}$  should be 200  $t_{CLK}$  in the condition of the unstable  $CLK$  operation during the power down mode.
19. For command/address and  $CK$  &  $\overline{CK}$  slew rate  $> 1.0V/ns$ .
20. Min ( $t_{CL}, t_{CH}$ ) refers to the smaller of the actual clock low time and the actual clock high time as provided to the device.

## Timing patterns:

$t_{CK} = \min, t_{RRD} = 2 \cdot t_{CK}, BL = 4, t_{RCD} = 3 \cdot t_{CK}$ , Read with Autoprecharge

Read: A0 N A1 R0 A2 R1 N R3 A0 N A1 R0 – repeat the same timing with random address changing

\*100% of data changing at every burst

Legend: A=Activate, R=Read, P=Precharge, N=NOP

**Read Operation**

**Write Operation /  $t_{\text{DQSS}} = \text{max.}$**

**Write Operation /  $t_{\text{DQSS}} = \text{min.}$**

**OPERATIONAL DESCRIPTION**

**BANK ACTIVATE**

The DDR SDRAM has four independent banks. Each bank is activated by the ACT command with the bank addresses (BA0,1). A row is indicated by the row address A11-0. The minimum activation interval between one bank and the other bank is tRRD.

www.DataSheet4U.com

**PRECHARGE**

The PRE command deactivates the bank indicated by BA0,1. When multiple banks are active, the precharge all command (PREA,PRE+A10=H) is available to deactivate them at the same time. After tRP from the precharge, an ACT command to the same bank can be issued.

**Bank Activation and Precharge All (BL=8, CL=2)**

A precharge command can be issued at BL/2 from a read command without data loss.

**READ**

After  $t_{RCD}$  from the bank activation, a READ command can be issued. 1st Output data is available after the  $/CAS$  Latency from the READ, followed by  $(BL-1)$  consecutive data when the Burst Length is  $BL$ . The start address is specified by  $A_{11}, A_9-A_0(x4)/A_9-A_0(x8)/A_8-A_0(x16)$ , and the address sequence of burst data is defined by the Burst Type. A READ command may be applied to any active bank, so the row precharge time ( $t_{RP}$ ) can be hidden behind continuous output data by interleaving the multiple banks. When  $A_{10}$  is high at a READ command, the auto-precharge (READA) is performed. Any command (READ, WRITE, PRE, ACT) to the same bank is inhibited till the internal precharge is complete. The internal precharge starts at  $BL/2$  after READA. The next ACT command can be issued after  $(BL/2+t_{RP})$  from the previous READA.

**Multi Bank Interleaving READ (BL=8, CL=2)**

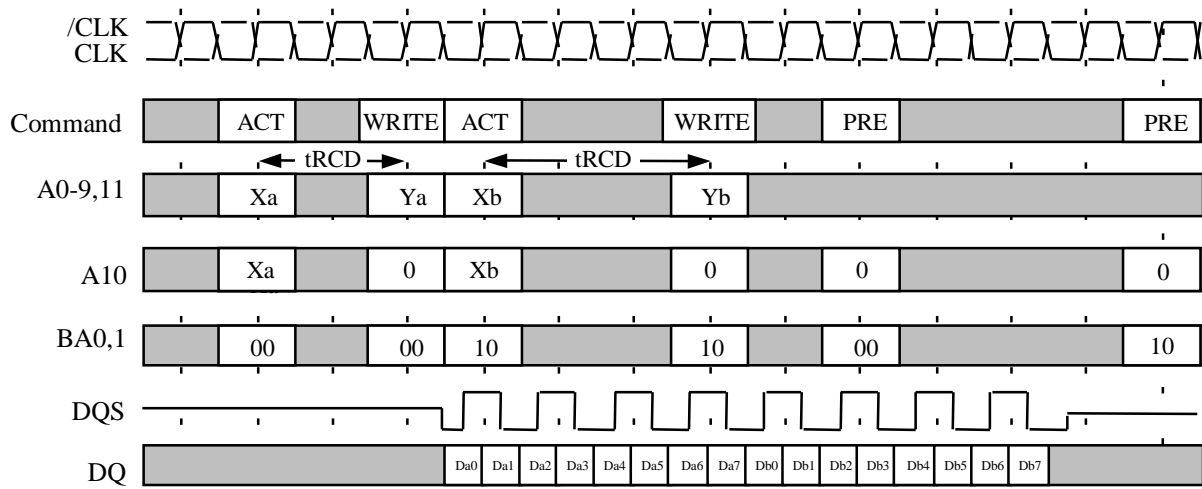

**READ with Auto-Precharge (BL=8, CL=2,2.5)**

**WRITE**

After tRCD from the bank activation, a WRITE command can be issued. 1st input data is set from the WRITE command with data strobe input, following (BL-1) data are written into RAM, when the Burst Length is BL. The start address is specified by A11,A9-A0(x8)/A8-A0(x16), and the address sequence of burst data is defined by the Burst Type. A WRITE command may be applied to any active bank, so the row precharge time (tRP) can be hidden behind continuous input data by interleaving the multiple banks. From the last data to the PRE command, the write recovery time (tWRP) is required. When A10 is high at a WRITE command, the auto-precharge(WRITEA) is performed. Any command(READ,WRITE,PRE,ACT) to the same bank is inhibited till the internal precharge is complete. The next ACT command can be issued after tDAL from the last input data cycle.

**Multi Bank Interleaving WRITE (BL=8)**

**WRITE with Auto-Precharge (BL=8)**

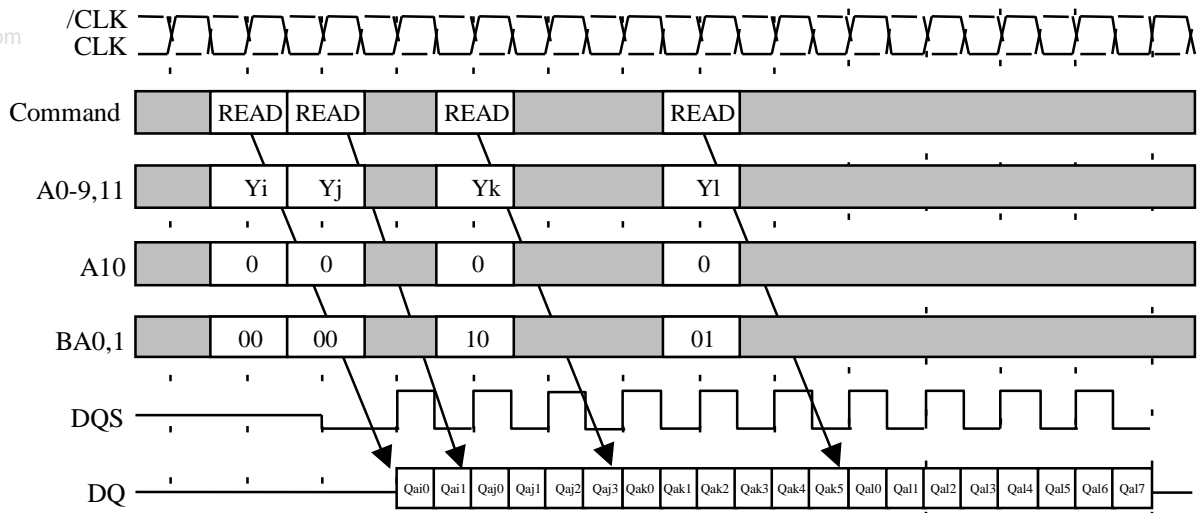

## BURST INTERRUPTION

### [Read Interrupted by Read]

Burst read operation can be interrupted by new read of any bank. Random column access is allowed. READ to READ interval is minimum 1CLK.

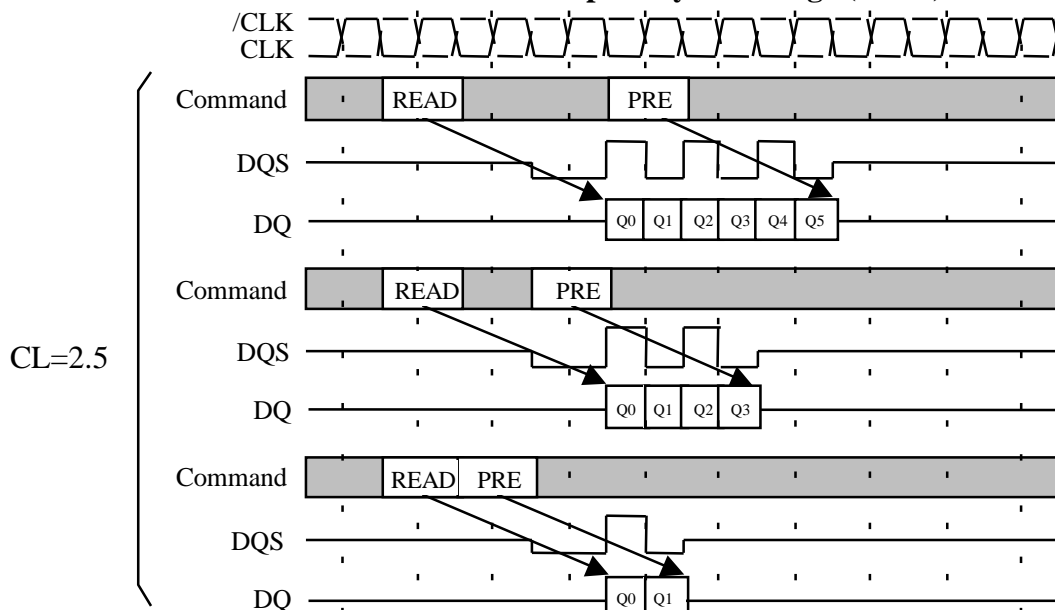

**Read Interrupted by Read (BL=8, CL=2)**

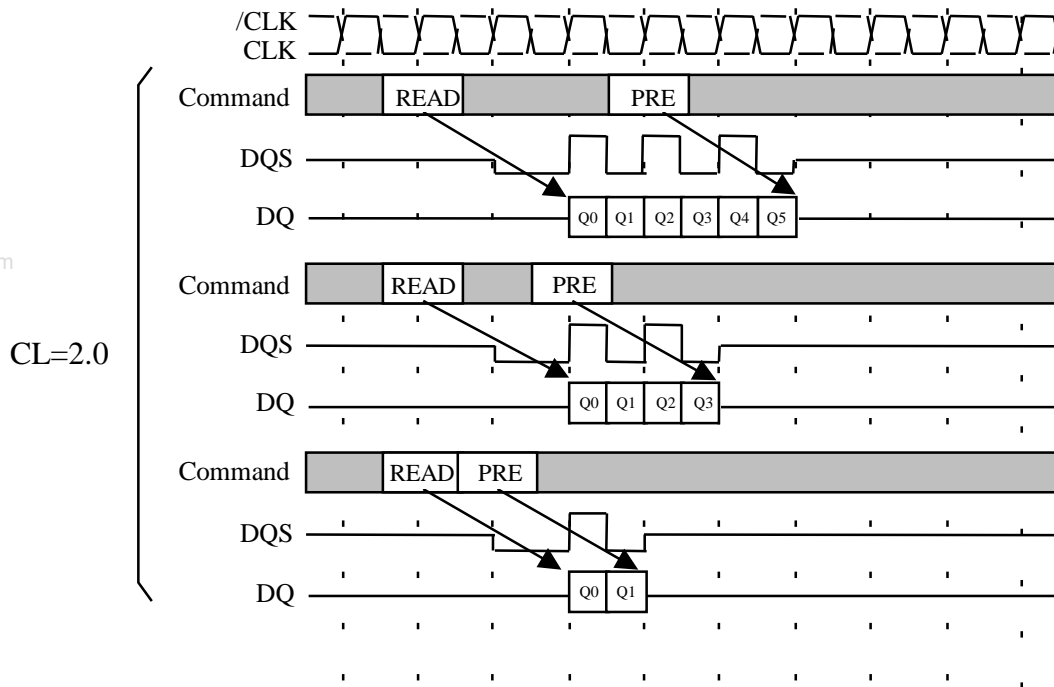

### [Read Interrupted by precharge]

Burst read operation can be interrupted by precharge of the same bank. READ to PRE interval is minimum 1 CLK. A PRE command to output disable latency is equivalent to the /CAS Latency. As a result, READ to PRE interval determines valid data length to be output. The figure below shows examples of BL=8.

**Read Interrupted by Precharge (BL=8)**

**Read Interrupted by Precharge (BL=8)**

**[Read Interrupted by Burst Stop]**

Burst read operation can be interrupted by a burst stop command (TERM). READ to TERM interval is minimum 1 CLK. A TERM command to output disable latency is equivalent to the /CAS Latency. As a result, READ to TERM interval determines valid data length to be output. The figure below shows examples of BL=8.

www.DataSheet4U.com

[Read Interrupted by Write with TERM]

**Read Interrupted by TERM (BL=8)**

**[Write interrupted by Write]**

Burst write operation can be interrupted by write of any bank. Random column access is allowed. WRITE to WRITE interval is minimum 1 CLK.

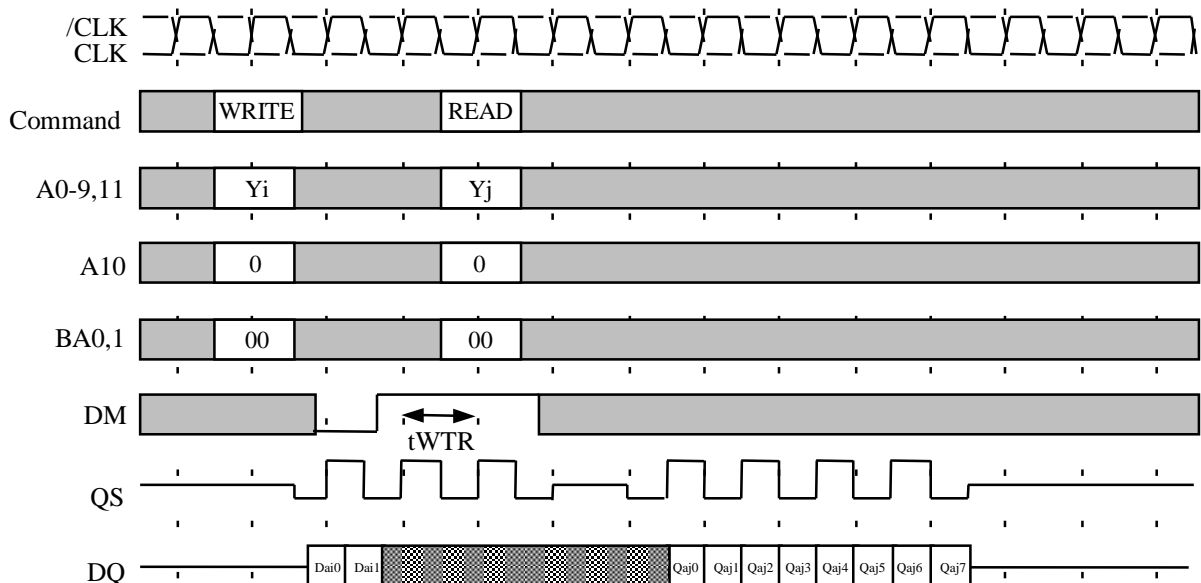

**Write Interrupted by Write (BL=8)**

**[Write interrupted by Read]**

Burst write operation can be interrupted by read of the same or the other bank. Random column access is allowed. Internal WRITE to READ command interval( $t_{WTR}$ ) is minimum 1 CLK. The input data on DQ at the interrupting READ cycle is "don't care".  $t_{WTR}$  is referenced from the first positive edge after the last data input.

**Write Interrupted by Read (BL=8, CL=2.5)**

**[Write interrupted by Precharge]**

Burst write operation can be interrupted by precharge of the same or all bank. Random column access is allowed.  $t_{WR}$  is referenced from the first positive CLK edge after the last data input.

**Write Interrupted by Precharge (BL=8, CL=2.5)**

[Initialize and Mode Register sets]

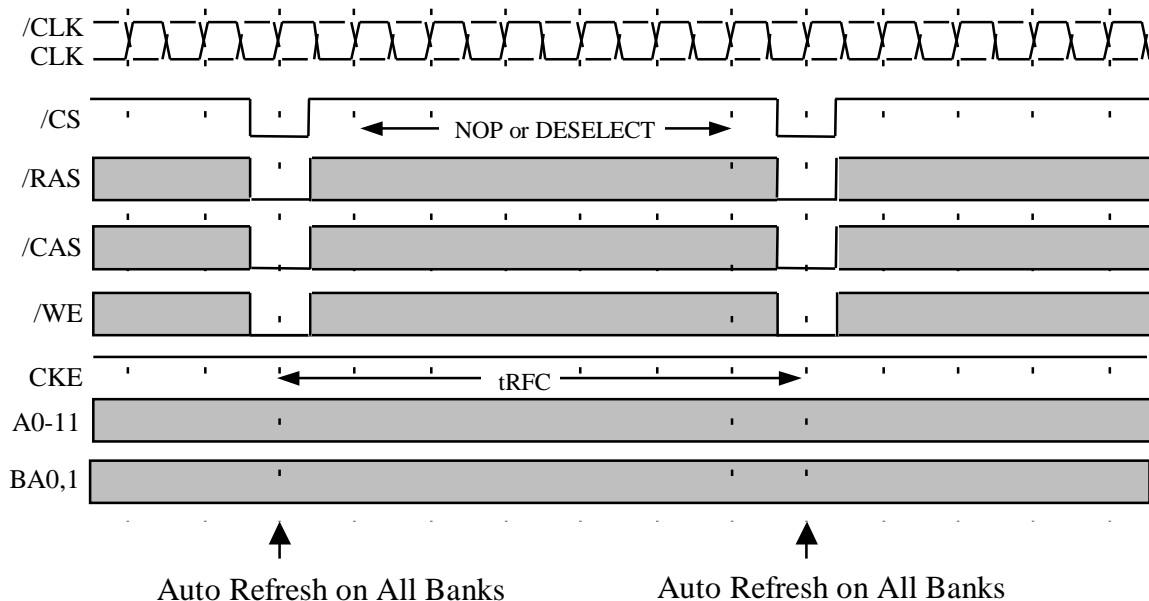

**Initialize and MRS**

[AUTO REFRESH]

Single cycle of auto-refresh is initiated with a REFA(/CS=/RAS=/CAS=L,/WE=CKE=H) command. The refresh address is generated internally. 4096 REFA cycles within 64ms refresh 128Mbits memory cells. The auto-refresh is performed on 4 banks concurrently. Before performing an auto refresh, all banks must be in the idle state. Auto-refresh to auto-refresh interval is minimum tRFC . Any command must not be supplied to the device before tRFC from the REFA command.

**Auto-Refresh**

**[SELF REFRESH]**

Self -refresh mode is entered by issuing a REFS command ( $\overline{CS}=\overline{RAS}=\overline{CAS}=L, \overline{WE}=H, \text{CKE}=L$ ). Once the self-refresh is initiated, it is maintained as long as CKE is kept low. During the self-refresh mode, CKE is asynchronous and the only enable input, all other inputs including CLK are disabled and ignored, so that power consumption due to synchronous inputs is saved. To exit the self-refresh, supplying stable CLK inputs, asserting DESEL or NOP command and then asserting CKE for longer than  $t_{XSNR}/t_{XSRD}$ .

www.DataSheet4U.com

**[Power DOWN]**

The purpose of CLK suspend is power down. CKE is synchronous input except during the self-refresh mode. A command at cycle is ignored. From CKE=H to normal function, DLL recovery time is NOT required in the condition of the stable CLK operation during the power down mode.

www.DataSheet4U.com

**Power Down by CKE**

**[DM CONTROL]**

DM is defined as the data mask for writes. During writes, DM masks input data word by word. DM to write mask latency is 0.

**DM Function(BL=8,CL=2)**
